### Sequence 1, Application US/09474076

| Sequence 1, Application US/09474076
| Patent No. 645527
| GENERAL INFORMATION:
| APPLICANT: Tomlinson, James E. APPLICANT: Tomlinson, James E. TITLE OF INVENTION: CLONING AND CHARACTERIZATION OF A HUMAN ADENYLYL
| TITLE OF INVENTION: CYCLASE
| FILE REFERENCE: 44481-5028-01-US
| CURRENT APPLICATION NUMBER: US/09/474,076
| CURRENT FILING DATE: 1999-12-12
| PRIOR PAPLICATION NUMBER: PCT/US98/13694
| PRIOR PLING DATE: 1999-12-01
| PRIOR APPLICATION NUMBER: 60/070,904
| PRIOR APPLICATION NUMBER: 60/070,904
| PRIOR APPLICATION NUMBER: 08/886,550

Patent No. 5334521
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Voshihiro Ishikawa
TITLE OF INVENTION: Cloning and Character-
TITLE OF INVENTION: 1zation of a Cardiac Adenylyl Cyclase
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Alan M. Gordon
ADDRESSEE: American Cyanamid Company
STREET: 1937 West Main Street,
STREET: P.O. Box 60

                                                                                                                                                                                                                    The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylycyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present cODNA sequence encodes human partial cardiac adenylcyclase VI (AVVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification

The present sequence encodes human adenylylcyclase isoform VI (AC-VI)

from the present invention. The present invention describes a
recombinant replication-defective viral particle (I) comprising a gene
encoding a beta-adrenergic signalling protein (beta-ASP) operably
cencoding a beta-adrenergic signalling protein (beta-ASP) operably
linked to a promoter. Also described are: (I) a recombinant pro-viral
plasmid (Ia) comprising a gene encoding a beta-ASP, as above, operably
linked to a promoter and further comprising a replication-defective
viral genome: (2) a (mammalian) cell transfected with (I) or (Ia); (3)
comprising AC-VII (AC-VII), or a variant having AC activity;
(4) a human AC-VI encoded by (3); (5) an isolated polynucleotide
sequence which hybridises at high stringency to (3); and (6) a vector
comprising the polynucleotide of (3); (I) can be used to form a
filtered adenovirus particle preparation. (I) is used to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GAACGCAATGGGCAGAAGCGTTCGCGGCGCGGTGGCACTCGGGCAGGTGGCTTCTGCACG 120

The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclases and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASPs is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification of the invention.

 present invention relates to methods and compositions for enhancing
          cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the mycocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating
                                                                                                                                                                                                                                                                                                                               180

The present invention relates to methods and compositions for enhancin cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytcyclases (also referred as adenylcyclase, andenylate cyclase and cAMP synthetase) and G-protein receptor Kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present CDNA sequence encodes human modified cardiac adenylcyclase VI (ACVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               181 CCTCGGTGCCCCTGGCAGGATGACGCCTTCATCCGGAGGGCGGCCCCANGCAAGGGCAAG 240

screened with a 970 bp Aatt-Hincil fragment from type I adenylyl screened with a 970 bp Aatt-Hincil fragment from type I adenylyl cyclase. DNA probe (encodes the first cytoplasmic domain of adenylyl cyclase, which has significant homology to other previously known types of adenylyl cyclase). One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into puclB and further subcloned on a sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete canine cardiac adenylyl cyclase gene. The gene is suspected of being involved in the regulation of cardiac function and it is thought that decreased activity of adenylyl cyclase gene. The heart may be a major factor in the development of heart failure. Thus the adenylyl cyclase gene is useful to screen cyds. which stimulate the activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA sequence encodes human type VI adenylyl cyclase (hAc6, see AAW30599) that is expressed mainly in the heart and brain. hAc6 has a similar putative structure to other adenylyl cyclase isoforms to but, like type V, is distinguishable in that it has a larger but, like type V, is distinguishable in that it has a larger region. Accompanyly cyclase PCK fragment as probe. The region hAc6 cDNA was initially isolated from a human heart CDNA library using an adenylyl cyclase PCK fragment as probe. It was instead to design primers that were used in a PCK-based RACE to obtain the full-length cDNA sequence. The invention relates to the hAc6 gene, methods for the recombinant production of purified hAc6 and the proteins made by these methods, antibodies against hAc6, vectors, probes and host cells (especially HEK-293) transformed by diagnostic and therapeutic uses for these various reagents. hAc6 can be used as a tool to screen for agonists and antagonists that the stimulate Advinting thAc6. Such compounds have therapeutic utility is a simulate that the second in the second constant and antagonists that the stimulate Advinting thAc6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CCCCGCTATATGAGCTGCCTCCGGGATGCAGAGCCACCCAGCCCCACCCCTGCGGGCCCC 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemia condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB19920z to AB1991z, encoding the protein sequences in ABB57020 to ABB5734) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase C_l and C_2 domains linked covalently.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acids from human chromosome 2p21-16.3
and the encoded peptide (and mouse and chicken orthologues) that
comprises a PGECCPLP group, an insulin-like growth factor binding protein
(IGFBP)-like domain, cysteine-rich domains, an RGD (undefined) group
and a transmembrane domain. The protein, e.g. CRIMI, interacts with
peptides of the transforming growth factor superfamily. A composition
comprising an expression construct comprising the nucleic acids of the
invention or a mimetic which antagonises or mimics an activity of a CRIMI
polypeptide may be used in a method for modulating the biological
activity of a polypeptide of the bone morphogenic protein (BMP) family.
In this way they may be used to prevent or treat an eye disease,
especially cataract formation. They may also be used to treat
cervedgenerative diseases, renal and kidney disease, bone and tooth
abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in
gene therapy by using antibodies directed against CRIMI polypeptides.
The present sequence is a Human genomic DNA containing exons 2-17 of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

The sequence represents a DNA encoding an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granolocyte colony stimulating factor receptor. Glucagon, interleukin 6, platelet-derived endothelial call growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and dispanosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatcous diseases such as asbestosis and vascular pathologies involving an endothelial abnormality such as deep vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; ds; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; multiple solarosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsorlatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; antiparkinsonian; nootropic; neuroprotective; osteopathic; articonvulsant; attracturitic; immunosuppressant; immunosuppressant; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidialematory; antibacterial; antiviral; antifungal; antirheumatic; antithfromia and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis,

                                                                                                                                                                                                                         and NWDA. The NWDAR2C gene was obtained by amplifying cDNA derived from human brain tissues with primers corresponding to sequences in the rat NWDAR2A receptor DNA and using the resultant fragments as probes to screen a cDNA library derived from human hippocampal RNA 4 basic clones were isolated: NWDA21 (AAQ79940), NWDA22 (AAQ79400), NWDA24 (AAQ79401) and NWDA26 (AAQ79402). The clones are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants (AAQ79403-7) of the NWDAR2C receptor were constructed. The expression of the genes allows the reconstruction of the NMDA receptor. The complete receptor can be used to identify compounds which bind or are antagonistic
                                    receptor 2C (NMDAR2C) gene clone NMDA24. This clone covers bases 861-4068 of the complete NNDAR2C gene (AA079372) with an insertion of 11 bp between bases 1300-1 and an insertion of 24 bp between bases 2350-1. The 11 bp insert adds an extra 3 a.a. to the peptide sequence but causes a reading frame shift which terminates the peptide at residue 494 of the NMDAR2C sequence. The NMDA receptor contains two subunits R1 (AAQ79370) and subunit R2 selected from the subunits 2A (AAQ79375), 2B (AAQ79377), 2C and 2D (AAQ79378). The receptor forms part of a family of NMDA receptors which have cation-selective channels and bind glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2807

The nucleotide sequence of the novel N-methyl-D-aspartate (NMDA)

receptor 2C (NWDAR2C) gene clone NWDA22. This clone covers bases
367-4068 of the complete NWDAR2C gene (AAQ79372) with an insertion of 11
bp between bases 1300-1 and a 15 bp deletion of bases 1960-74. The 11 bp
insert adds an extra 3 a.a. to the peptide sequence but causes a reading
frame shift which terminates the peptide at residue 494 of the NWDAR2C
sequence. The NMDA receptor contains two subunits: subunit R1 (AAQ79370)
and subunit R2 selected from the subunits 2A (AAQ79375), 2B (AAQ79370)

c and subunit R2 selected from the subunits 2A (AAQ79375), 2B (AAQ79370)

c and subunit R3 selected from the subunits and bind glutamate and
c receptors which have cation-selective channels and bind glutamate and
c numan brain tissues with primars corresponding to sequences in the rat
c NWDARA receptor DNA and using the resultant fragments as probes to
screen a cDNA library derived from human hippocampal RNA. 4 basic clones
were isolated: NMDA21 (AAQ7999), NMDA22 (AAQ79400), NWDA24 (AAQ79401)
and NMDA26 (AAQ79402). The clones are thought to be splice variants of
and NMDA26 (AAQ79402). The sequence of the 4 clones, a series of variants
(AAQ794037) of the NMDARAC receptor were constructed The expression of
the genes allows the reconstruction of the NMDA receptor. The complete
teceptor can be used to identify compounds which bind or are antagonistic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    73 CAGAAGCGTTCGCGGCGCCGTGGCACTCGGGCAGGTGGCTTCTGCACGCCCCCGCTATATG 132

receptor 2C (NWDAR2C) gene clone NWDAR2C-delta15-delta51. This clone
contains bases 1-1959, 1975-2350 and 2402-4068 of the complete NWDAR2C
sequence (AAQ79372). The variant differsfrom the full length sequence by
c 315-14401. A series of variants (AAQ79403-7) of the NWDAR2C receptor
were constructed, by recombination, based on the sequence of the 4 basic
clones: NWDA21 (AAQ79499), NWDA22 (AAQ79401) and
NWDA26 (AAQ79402). The NWDA receptor contains two subunit R1
(AAQ79370) and subunit R2 selected from the subunits 2A (AAQ79401)
(AAQ79377), 2C and 2D (AAQ79378). The receptor forms part of a family of
NWDA receptors which have cation-selective channels and bind glutamate
and NWDA. The expression of the genes allows the reconstruction of the
NWDA receptor. The complete receptor can be used to identify compounds
which bind or are antagonistic to the human NWDA receptor.
                                                                                                                                                      N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel; glutamate; hippocampus; rat; pcDNA1; NMDA receptor; antagonist; ds.
